                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to a sequencing problems, such
as compressions and repeats; all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (29-AUG-2002) Genome Sequencing Center, 4444 Forest Park

It currently consists of 62 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Web site: http://www-seq.wi.mit.edu

The invention relates to 9672 polynucleotides (ACL53866-ACL63537) which are differentially expressed in colon cancer cells. The invention also celates to vectors and host cells comprising a differentially expressed polynucleotide of the invention; a method for detecting a cancerous cell by detection of a gene product of the polynucleotides; a method for inhibiting a gene product of the polynucleotides; a method of treating an individual with cancer by administration of a modulator of a gene product of the polynucleotides; and an isolated antibody that specifically binds to a polypeptide encoded to the diagnosis, prognosis and management of cancer; for the antibodies, and methods are useful for the detection of cancerous cells; for the diagnosis, prognosis and management of cancer; for the identification of agents that modulate the phenotype of cancerous cells; for the identification of therapeutic targets for cancer chemotherapy; and for the treatment of cancer, specially colon cancer and metastasized colon cancer, but also breast or pancreatic cancer. The polynucleotides are also useful as a source of probes or primers for use in diagnostic methods. The differentially expressed polynucleotides or their encoded proteins can additionally be used as vaccines to modulate primary immune response for the prevention or treatment of cancer. The present secuence represents a specifically claimed polynucleotide which is differentially expressed in colon cancer. Note: The sequence data for this patent did contraction of the printed specification, but was obtained in
                                                                                                                                                            New isolated polynucleotides, which are differentially expressed in colon cancer cell, useful for treating cancer, e.g. colon cancer, breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene; ds; breast cancer; breast cancer-associated gene sequence; drug development; pharmacogenetics; biosensor development.

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a blological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or preast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-cresolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT0763 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                           Detecting a breast cancer-associated transcript in a patient's cell, useful for disagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in cased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polymeleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell cor treating lung cancer, non-small cell cor treating lung cancer, such as small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchhectasis. The genes, polymucleotides and polymeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                                                                                                                                                                                                                                                                                                                             Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynuclectide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polymuclecide that selectivel hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, is electing mode of therapy, detecting mode of the nucleic acids and as vaccines. This sequence corresponds to one of the nucleic acids
                               cytostatic; gene therapy; vaccine; ovarian cancer; diagnosis; post-operative chemotherapy; radiation therapy; tumour prognosis; pre-cancerous lesion detection; ds; gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used for the detection method of the invention.
 Ovarian cancer-associated transcript #34.
                                                                                                                                         Location/Qualifiers

Claim 8; SEQ ID NO 41; 1385pp; English

Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.

whose expression is upregulated or downregulated in specific cancers or other diseases such as anglogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The nucleic acid of the invention, antibodies which specifically bind a nucleic acid of the invention; use of such antibodies for drug targeting, and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, and nucleic acids. The nucleic acids, polypeptides, and nucleic acids. The nucleic acids, polypeptides, and nucleic acids of the invention such as psoriasis, ischaemia, heart disease, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atterosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention. The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

ABV99349 standard; DNA; 1156

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nuclei caid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; p53 pathway; Leucine rich repeat capricious related protein; LRRCAPS; cancer; gene therapy; ds.

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any under from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or disquences and proteins are useful for treating, preventing or disguences, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's cancer, neurodegenerative diseases, Alzheimer's disease, parkinson's disease, immune disorders, haematopoietic disorders, cardiovasquiar disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with chonic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods

The present sequence encodes the human 574 tumour-associated antigen (TAA). The TAA 574 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inculated with a virus expression vector containing the present sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                  Human, TAA; tumour-associated antigen; anti-tumour; cytostatic; immunostimulant; vaccine; carcinoma; colorectal cancer; gastric cancer;

Human cDNA differentially expressed in MYCN activated cells SeqID 105

human; differential expression; transactivator; proto-oncogene; neuroblastoma; small cell lung cancer; cytostatic; gene therapy; 88; MYCN activated cell.

```
The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent blased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway—modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

```
expressed in MYCN activated cells. Specifically, it refers to polymucleotide sequences that exhibit differential expression patterns in polymucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a proto-concogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these CDNA molecules is useful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the CDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polynucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the US Patent Office at

```
The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient. The method comprises that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 encode the human bladder cancerassociated proteins given in ABR48146 to ABR48145. Bladder cancerassociated proteins given in ABR48146 to have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancerassociated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ಗ

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in creased or decreased expression in lung cancer samples. Lung cancer samples in Lung cancer compound that modulates a lung cancer-associated polymeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell corrections cancer in operations, contact by cancer or other benign or precancerous lesions, e.g. ateleotasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polymucleotides and polymeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polymucleotides of the Lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; antinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesson; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis. Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased Claim 22; Page 335; 453pp; English. 10-MAY-2001; 2001US-0290492P. 09-NOV-2001; 2001US-0339245P. 13-NOV-2001; 2001US-035066EP. 29-NOV-2001; 2001US-0334370P. 12-APR-2002; 2002US-0372246P. ```
The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capriclous related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in
                                                                                                                                                                                                                                                                                                                                                                     Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                 ä

```
The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capticious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent blased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, differential expression, cancer, angiogenic disorder,

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, attended necesclerosis, inflammatory diseases, autoimmune diseases, retinal necowascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention. The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polymucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Smith V;

The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                     Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of five genes in a cell sample taken from patient, to control levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2053 BP; 461 A; 602 C; 499 G; 491 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

The invention relates to human tumour-associated antigenic target (TAT)

CC polypeptides, and their related nucleic acids. The TAT polypeptides are

coverexpressed in cancer tissues compared to normal tissues, and may thus

serve as effective tragets for the diagnosis and treatment of cancer in

cm ammals. The invention also relates to nucleic acid and polypeptide

sequences at least 80% identical to the TAT nucleic acids and

colypeptides, expression vectors and host cells comprising a TAT nucleic

cold, an antibody specific for a TAT polypeptide; a peptide or organic

molecule which binds to a TAT polypeptide; fusion proteins comprising a

CC TAT polypeptide; and methods and compositions for the treatment or

diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,

antibodies, antagonists, binding molecules and compositions are useful

coloractal cancer, lung cancer, carricularly cancers such as breast cancer,

coloractal cancer, lung cancer, carrical cancer, liver cancer, bladder

coloractal cancer, nuls cancer, cervical cancer, inver cancer, bladder

concertal cancer, melanoma and leukaemia. TAT nucleic acids mapping, in

chromosome identification probes, in chromosome and gene mapping, in

chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                          New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 2053 BP, 461 A; 602 C; 499 G; 491 T; 0 U; 0 Other;

This invention relates to a novel screening method identified as a multicarameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals invention then describes the screening of candidate pharamecutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, as including schizophrenia, bipolar affective disorder (BAD) and autism, as well as Parkinson's and Alzhaimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, nethod used in MPHTS will be automated, such that a large number of test method used in MPHTS will be automated, such that a large number of test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           compounds may be rapidly screened with a minimal amount of labour and effort. This polynucleotide is a human cDNA sequence of a gene that is differentially expressed in the presence of a therapeutic compound and represents an exemplary efficacy gene for bipolar affective disorder, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chromosome mapping; gene mapping; gene therapy; forensic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in adaptored and polymucleotide sequences have applications in the produce other types of data and products dependent on DNA and mino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                      New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2338 BP; 519 A; 677 C; 608 G; 534 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length:

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this aptent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            signal transduction; glycoprotein; transcription;

                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                        length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ trarget molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                   This invention relates to a novel primers useful for synthesising full
                                                                                                                                                New oligonucleotide primers (830 cDNAs) useful for synthesizing full length human cDNAs.

830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                      The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers anable the production of the full length human cDNA of the invention. Note: The sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STATÉ; immunogen; STAT6 activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; autoimmune disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; ischaemic lupus erythematosus; sepsis; asthma; allergic rhinitis; AIDS. ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.

for screening
                                                                                                                                                                                                                                       The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the trating a disease associated with STAT6 activation such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                      allergic disease, inflammation, autoimmune diseases, diabetes, the prelipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STATS activation and/or prevention of Thi hyperactive disease. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STATS compounds for treating and preventing disease associated with excessive activation or inhibition of STATS. The present sequence represents a human cDNA encoding a protein which promotes STATS activation.
                                                                                                          New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; medicine; signal transduction; glycoprotein; transcription;

```

```
This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bovine; 88; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.
                                                                                                                                                                               New oligonucleotide primers (830 cDNAs) useful for synthesizing full
length human cDNAs.

The invantion relates to a purified mucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising an electrically hybridise to a second complete acid molecule comprising an LMFD nucleic acid molecule comprising an LMFD nucleic acid linked to a promoter and a 3' non-translated sequence that acid linked to a promoter and a 3' non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising and the comprising a level or pattern of a molecule in a bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for breeding, preparation of complementary nucleic acid acid, where complementary nucleic acid acid, where the detection of the molecule. The LMFD nucleic acid is used for breeding, preparation of complementary nucleic acid is used for the gracefically improving cattle. The present sequence is one of the complement sequence was not shown in the specification but was obtained in preparation of expression or present sequence was not shown in the specification but was obtained in a power and an all and an addition and 
                                                                                                                                                         New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 343 BP; 40 A; 146 C; 108 G; 49 T; 0 U; 0 Other;

```
The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in disgnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 tissues, and in cell culture media. Antibodies specific for the 574 incapation process may form part of a disgnostic method e.g. the foctal isolating foctal cells from maternal blood. The isolation process may form part of a disgnostic method e.g. the foctal section are useful for isolating foctal cells from maternal blood. The isolation process may form part of a disgnostic method e.g. the foctal section are useful for isolating fortal cells from maternal blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus (es) The present sequence encodes feline 514 protein

```
The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further class I pervides a polypeltope string comprising the 5T4 epitope; a nucleic acid sequence encoding the 5T4 epitope or a polypepitope; a nucleic acid comprising the string of the 5T4 epitope or a polypepitope of the 5T4 epitope, a vector system capable of delivering the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polypepitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of molecile. The 5T4 epitope has cytostatic activity. The vaccine is method comprising the 5T4 epitope or its encoding nucleic acid and the vector of particularly cancer. The detection method is useful for diagnosing or particularly cancer. The detection method is useful for detecting the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the feline or preventing a disease. This polynucleotide sequence represents the feline or string the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. The specification describes the use of a single chain antibody (SCFV), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The SCFV antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The SCFV antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system disorders including Parkinson's disease, pariodontal diseases, cardiopulmonary diseases, cardiovascular diseases, gastrointestinal disorders, infections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce SCFV of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the concofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used in disquestic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The solation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). encoding the Novel canine or feline 5T4 polypeptide and polynucleotides encodir polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat. Canine; dog; oncofoetal leucine-rich glycoprotein; 574; tumour; cell proliferative disorder; infection; inflammatory condition; cancer immunotherapy; foetal cell; maternal blood; cytostatic; foetal abnormality; foetal sex determination; gene; ss. cDNA encoding canine oncofoetal leucine-rich glycoprotein, 5T4 Sequence 1263 BP; 200 A; 469 C; 377 G; 217 T; 0 U; 0 Other; The present sequence encodes canine 5T4 protein 1263

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CyG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs
                                                                                                                                                                                                                                                                                                                                                                      Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons diagnosis and prognosis, con from chemically treated DNA.

Claim 12; 56pp + Sequence Listing; 56pp; German.

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (c) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonomic and of puppoints and the degree of hybridiseation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of This invention describes a novel method for determining the degree of

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the

degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovoscular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, 8), and (11) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ34121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target c is amplified to form a labeled amplicon. ABGULT 4
ABG42585
ABG

The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nuclest acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP'S); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation catatus of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for the method of the method in the The invention relates to a method used for evaluating the toxicity of an agent comprising determining the expression of a rat toxic response gene(s) in the test animal in response to the agent. The method is useful in drug development, particularly for conducting toxicity studies and each with at least one member Bvaluating the toxicity of an agent, useful in drug development or in determining toxicological responses to a new drug, by determining the expression of rat toxicologically relevant genes in the test animal in Rat; toxicity study; rat toxic response gene; toxicological response; drug development; phase-1 rat CT gene; ds. ina Predicting the liver toxicity of an agent to an individual by using test expression profile with a set of reference expression profiles Predictive Model to determine whether the agent will reduce liver toxicity in the individual.

Claim 2; Page 150; 379pp; English.

The invention relates to a novel method for predicting the liver toxicity of an agent to an individual comprising obtaining a biological sample from an individual treated with the agent, measuring the expression of one or more liver toxicity predictive genes in the sample and using the test expression profile with a set of reference expression profiles in a predictive model to determine whether the agent will reduce liver toxicity in the individual. The method of the invention may be useful for predicting the liver toxicity of an agent to an individual. The current sequence is that of the liver toxicity predictive DNA of the invention which represents a 24 hour combo All gene

Claim 7; Fig 4; 336pp; English.

The present invention describes a method for predicting the liver toxicity in an individual to an agent. The method comprises: (a) obtaining a biological sample from the individual treated with the agent; (b) measuring the expression of one or more liver toxicity predictive corners in the sample; and (c) using the test expression profile with a set of reference expression profiles in a Predictive Model to determine whether the agent will induce liver toxicity in the individual. Also described: (1) predicting the liver toxicity of an agent using an individual, in vitro cell cultures or explants to an agent via a programmable machine; (3) a computer program product for enabling a computer to perform Predictive Model analysis for liver toxicity on a projectal sample from an individual, in vitro cell cultures or explants to an agent; (4) a computer system adopted to predict liver toxicity in a biological system from an individual, in vitro cell cultures or explants to an agent; (5) a computer program product for predictive of from a test sample expression profile; (6) mining genes predictive genes. The method is useful for predicting the liver toxicity in an individual to an agent. The present sequence represents a liver toxicity predictive gene agent. The present sequence represents a liver toxicity predictive gene agent. The present sequence represents a liver toxicity predictive gene agented that represents a liver toxicity in an individual to an agent. The presents a liver confocity predictive gene agented that represents a liver toxicity in an individual to an agent. The present sequence represents a liver toxicity predictive gene agent. The present sequence represents a liver toxicity predictive gene agent. sequence that represents a 24 hour combo 3 gene, which i claimed in the exemplification of the present invention.

```
This invention relates to novel isolated kidney toxicity predictive genes and methods of using such genes in the field of toxicology. Specifically, it refers to novel genes that can be used for generating predictive models, which in turn are useful for predicting the in vivo toxic response to one or more agents. The present invention describes obtaining a gene expression profile from a biological sample and using the predictive model to determine whether an agent will induce kidney toxicity in the individual. As such, it can be used to detect any toxic effects that may be manifested as long lasting or chronic consequences including irreversible toxicity or carcinogenesis. Furthermore, the predictive genes can be considered as therapeutic targets for toxic damage or to ameliorate specific disease conditions such as kidney tubule necrosis or acute renal failure, as well as for additional screening assays. This polynucleotide sequence is the partial gene sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Predicting kidney toxicity in an individual to an agent, useful for predicting toxic responses to one or more agents comprising measuring the expression of one or more kidney toxicity predictive genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                kidney toxicity; toxicology; predictive model; gene expression profile; toxic damage, kidney tubule necrosis; acute renal failure; rat; ds.

The invention relates to a novel composition comprising cDNAs for use in detecting the altered expression of genes in a toxic response of the spleen, where the cDNAs comprises 50-816 base pairs (ADR91045-ADR91348) or their complements The invention further comprises:

CC spleen, where the cDNAs comprises 50-816 base pairs (ADR91045-ADR91348) or their complements The invention further comprises:

CC spleen toxicity in an individual to an agent; predicting the spleen toxicity in an individual to an agent; predicting the spleen toxicity from an expression profile of nucleic acids from a sample under test, comprising a computer program product for predicting spleen toxicity from an expression profile of nucleic acids from the cDNAs, and a predictive model for causing a general purpose computer to predict the spleen toxicity of the sample based upon the crahing data set, the list of genes selected from the CDNAs, and the composition profiles of spleen toxicity, comprising means for measuring system for predicting spleen toxicity, comprising means for measuring compression profiles of spleen predictive model. The composition comprising compassion profiles of spleen predictive model. The composition comprising compass is useful for detecting altered expression of genes in a toxic response of the spleen or for predicting toxic responses to one or more agents including lymphoid tissue types or other species. The predictive agents and models of the invention are useful for identifying and an expension of genes and models of the invention are useful for identifying and and models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   represents one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   genes and models of the invention are useful for identifying and evaluating various in vitro systems that can be used to accurately predict in vivo toxicity. This polynucleotide sequence represents the genes predictive for spleen necrosis of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BP; 168 A; 177 C; 157 G; 185 T; 0 U; 4 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 691

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in cother Bacillus cells, comprising hybridising labelled mucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus isolated from Bacillus cells to a substrate containing array of Bacillus celerated from Bacillus cells an observed hybridiation reporter signal of a spot in the array. The method is useful for measuring the expression of a spot in the array. The method is useful for monitoring contain or more second Bacillus cells. The method is useful for monitoring global expression of several genes from a Bacillus cell, discovering new companion problem of genes in one copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions.

Cup characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available.

Chis sequence represents a genomic sequence information is available.

Chis sequence represents a genomic sequence tag (GST) used in the method of the invention. Note: The sequence data for this patent did not form to part of the printed specification, but was obtained in electronic format correctly from NIPO at ftp. hubblished\_pct\_sequences

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the captocoxicity of a compound, comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or core genes listed in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the toxic response and predict cellular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid support in Kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer

expression level in a tissue or cell sample exposed to a hepatotoxin of a set of genes comprising at least two genes listed in the specification, and a user interface to view the information used to present information identifying the expression level in a tissue or cell of at least one gene listed in the specification. The method is useful for elucidating global changes in gene expression and for identifying toxicity markers in tissues or cell exposed to a known toxin. The genes may be used as toxicity markers in drug screening and toxicity assays. The genes and gene expression information may be used as diagnostic markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound or agent. Hepatotoxicity is characterised by centrilobular necrosis and statosis. The present sequence is an expressed sequence tag (EST) or cDNA derived from a gene which is differentially expressed in response to a hepatotoxic agent comprising a database containing information identifying the \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$**\$**

GENE-) GENE LOGIC INC

Castle A, Elashoff M; Higgs B, Johnson K, Mendrick D, Porter M, WPI; 2003-689530/65. Predicting a toxic effect of a compound, useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays, comprises preparing gene expression profile of tissue or cells exposed to :he compound

Claim 1, SEQ ID NO 3678; 1156pp; English.

The present invention relates to a method for predicting a toxic effect of a compound. The method comprises preparing a gene expression profile

gene expression profile to a database comprising SEQ ID 1-4925, where differential expression of the gene indicates at least one toxic effect. The method is useful for predicting at least one toxic effect. The method is useful for predicting at least one toxic effect of a compound, identifying an agent that modulates the onset or progression of a toxic response, predicting the cellular pathways that a progression of a toxic response, predicting the cellular pathways that a compound modulates in a cell, and identifying an agent that modulates at least one activity of a protein. The method and compositions of the present invention using a database of genes having liver toxin-induced differential expression, are useful in identifying toxicity markers in sequence data for this patent ding screening and toxicity markers in sequence data for this patent din electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

DNA sequences of macaque genes expressed in brain or testis and its evolutionary implications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Custom primers were used for 5' and 3'-end sequencing. The full-insert sequencing was done by primer-walking method using ABI DNA sequencer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     764. .. 2026

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 184, UK. B-mail enquiries: vega@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk

On Dec 15, 2000 this sequence version replaced gi:11558491.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL: Sw: SWISSROT; Tr:, TREMBL: Wp:, WORNPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group.

**NOTE: Estimated insert size: 153789; sum-of-contigs estimation

**NOTE: Estimated insert size: may differ from sequence length

**NOTE: Estimated insert size may differ from sequence length

**NOTE: This is a "working draft' sequence It currently

**Consists of contigs. The true order of the pieces

** is not known and thair order in this sequence record is

** arbitrary. Gaps between the contigs are represented as

** runs of N, but the exact sizes of the gaps are unknown.

** This record will be updated with the finished sequence

** as soon as it is available and the accession number will

** be preserved.
